AutoCAD LT AutoCAD LT (formerly AutoCAD for Windows) is a product line from Autodesk that is aimed primarily at architectural, mechanical and civil engineering customers. It allows non-technical users to create drawings with ease. AutoCAD LT is now a full AutoCAD successor with the release of AutoCAD LT 2018. AutoCAD LT is based on the same native platform as AutoCAD, is for use on Windows operating systems, and runs in-place of AutoCAD in the same installation. It uses the same native file formats as AutoCAD, allowing the import of drawings created in AutoCAD. Unlike AutoCAD, the native file formats of AutoCAD LT are not compatible with AutoCAD LT or other AutoCAD applications. In contrast to AutoCAD, AutoCAD LT uses a network-based installation model with a standalone installer. A related product is AutoCAD Architecture (AutoCAD A\C), which was first introduced as AutoCAD LT Architecture in version 2013, and then as AutoCAD Architecture in 2016. It was discontinued on 2019. ObjectARX ObjectARX is an Object Pascal based C++ class library with an extensible data structure for structuring drawings. It is used by various add-ons and the integration with Autodesk Exchange Apps. It is also available as a free third-party product named EasyARX. AutoCAD Architecture AutoCAD Architecture (AutoCAD A) is an architectural CAD system from Autodesk. It was discontinued in 2012. A multiscale modeling protocol is developed to explore the solvent and the protein surfaces in explicit solvent. To this aim, a coarse-grained model is used to study a single protein, the HIV protease dimer. The force field is coarse-grained at the level of the C(α) atoms, while the solvent is treated explicitly. The protein is embedded in a coarse-grained environment that mimics the water, that is fluid at a length scale of the protein. The interaction energy of the protein-solvent system is assessed by a coarse-grained Monte Carlo simulation. A low-resolution protein model, obtained by elastic network mode decomposition, is placed in a coarse-grained solvent which is used to coarse grain the protein by a hybrid Monte Carlo simulation. This procedure is applied to the HIV protease dimer, a protein for which explicit solvent simulations have been performed, and to a benchmark set of protein-ligand complexes. The simulations are benchmarked against explicit solvent simulations and show a very good agreement for the protein-solvent interaction. Expression of thymus-specific genes in murine and human thymus cell lines. The expression of the gene of the heavy chain of the mouse and human T cell-specific differentiation antigens was studied in thymus cell lines and in cell lines representing different maturation stages of T cells and thymic stromal cells. The gene was expressed by C3H mouse thymus cell lines and by a number of lines established from human thymus. The expression of the gene was temperature-sensitive and blocked by treatment with

Neurotransmitter and interneuron identification by light microscopic immunocytochemistry in the rainbow trout (*Salmo gairdneri*): correlation of light microscopic immunocytochemistry with intracellular recordings in the optic tectum. Immunocytochemical techniques were used to study the distribution of substance P (SP), gamma-aminobutyric acid (GABA), glycine, acetylcholine (ACh), and tachykinin immunoreactivity in the tectum of the rainbow trout (*Salmo gairdneri*). The results were correlated with intracellular recordings obtained in the same tissue. Two monoclonal antibodies against rat substance P (SP-1 and SP-2) and against human tachykinins (H-13 and H-75) were used as primary antibodies, while polyclonal antibodies against rat SP (SP-3), rat tachykinins (H-84, H-79, and H-63), and rat and human glycine (Gly-1 and Gly-2) were used as secondary antibodies. SP-1, SP-2, and H-13 antibodies clearly labeled
