Hewlett-Packard engineers introduced HP Setup Utility for Notebooks on Dec. 5, 2009, to help notebook users properly configure their BIOS in order to get the best performance from their system, as well as to make sure that users can protect against unauthorized changes. Based on the latest BIOS version, HP Setup Utility for Notebooks provides users with a number of useful options and it can easily be accessed by right clicking on the Start button in the lower left corner of the screen. As usual, the Start menu is divided into several categories according to the purpose the user wishes to achieve, so clicking on the BIOS Setup category is what will take them to the right page. The next step will lead them to the dialog window in which they can choose whether to create a new BIOS configuration or to edit the existing one. If the user wants to create a new configuration, they can either do it manually or make use of the wizard that is provided, otherwise, they can choose to edit the existing one. Either way, the instructions provided are very easy to follow and if the user doesn't wish to follow the steps provided, the wizard is there to help them out. After taking into consideration the platform type and the version of the BIOS, the configuration will be created. As this is an automated process, after clicking the Finish button, the user will have to wait a few moments for the entire process to be completed. Now that the configuration is ready, the first thing to do is to apply the changes. If the user knows what they want to do, they can go directly to the list of supported BIOS versions and select the appropriate one. If not, they can always access the HP Setup Utility configuration page, where they can select the version they want to apply and then click on the Ok button. Once the changes have been applied, the next thing to do is to reboot the system. In order to perform this action, the user will have to insert the BIOS Administrator password that was set up. Once they do so, they can easily reboot the notebook by clicking on the button titled Reboot. This action will display a warning message to tell users that the system is about to reboot.
