Na⁺ channel block at sites other than the external mouth of the pore. The Na⁺ channel of the squid giant axon undergoes a slow inactivation that is voltage-dependent and slow relative to both the activation and the recovery from inactivation of the channel. The data are consistent with a model of voltage-dependent block of the channel by intracellular toxins. However, while the slow inactivation is blocked by tetrodotoxin, it is insensitive to heptanol, and it is neither blocked nor slowed by the inhibition of phosphorylation by the Ca²⁺/calmodulin-dependent phosphatase.

Mozilla today launched the beta for Firefox 4, the newest version of the browser and the first version to be officially built on the new Gecko 1.9.1 core. In what is the first time that the browser maker has brought Gecko 1.9.1 into production, Firefox 4 includes significant improvements in speed and battery life. Mozilla says that Firefox 4 offers faster page load time thanks to a rewrite of many parts of the browser that account for more than 50 percent of the browser's code. The
